The Role of Sounding During Birth

Seajay Starsparks

I suspect that the role of sounding during birth is more crucial, more sacred, and more functional than anyone imagines at this time. I know there is research about dolphins assisting humans in birth, and that their sounds are an important part of this process. In my compilations about this, I will be drawing from any possible sources—I am interested if there is anything in occult literature about ancient Egyptian, Atlantean, sound/healing technologies. (Whether Atlantis and such places existed I feel is less important than possible ideas of sound in birth.) I'd also like to acquire actual tapes of women birthing, from any who'd be willing to share something so personal, to look for patterns and other things. Right now how to compile and experience this information is a bit vague, but it's a subject I feel whose time is overdue. In my one birthing experience, I can honestly say that I could not have given birth in an easy and natural way without the opportunity to freely make whatever sounds needed to come through. Just as radionics and certain sound vibrations during birthing could correct physical problems—move a placenta, for instance—(I can hear the OB's hooting with laughter at that one . . .) Perhaps midwives of long forgotten civilizations were experts in sound—with a voice or special instruments—and commonly practiced physical interventions of today were used only in emergencies.
